OTHER PAPER	65
ELECTRONICS	72
OTHER MATERIALS	74

INTRODUCTION

The *Directory of Markets for Recovered Materials* was created to help community leaders, and private recyclers, plan and implement responsible solid waste management. It is funded by the Environmental Improvement and Energy Resources Authority (EIERA), to provide information on end users, brokers, and material recovery facilities (MRF's) for recovered materials.

Collecting recyclables is fairly simple. There are many options on what materials are collected, how they are collected, how often to collect, etc. The real dilemma comes after you have collected the recyclables. How do you process these materials, if you process them at all, and to whom do you sell them? How much revenue can you expect and what will be the expenses.

The answers to all of these questions begin with finding the right "market" for your recyclables. That may be as simple as giving all your materials to a local processor (you will still save on trash collection costs and disposal fees), or processing the materials yourself and selling those materials to a recovered materials buyer or broker. The information in this directory is intended to provide you with some of the contacts you will need to make those decisions.

The directory was compiled by faxing the attached form to over 350 recovered material markets in Missouri and surrounding states. Approximately 89 forms have been returned and that information is contained within. As more recovered material markets respond with the services they offer, that information will be added to future updates and added to the EIERA's home page at <http://www.dnr.mo.gov/eiera/index.html>. This database can be downloaded for use on Microsoft's Access 97 and above.

Recovered material markets that were not included in this initial directory may complete the following form. This information may be mailed or faxed to:

Environmental Improvement and Energy Resources Authority
325 Jefferson Street
P.O. Box 744
Jefferson City, MO 65201
573-635-3486 fax

Missouri Recovered Material Markets Directory

I. Please complete the following information and fax to 573-635-3486

Organization Name: _____

Contact Person: _____

P.O. Box or Street Address: _____

City: _____ State: _____ Zip: _____

Phone: (_____) _____ Ext. _____ Fax: (_____) _____

E-mail address: _____

Homepage address: _____

II. How would you classify or describe your company? (Please select only the best description).

_____ A. Manufacturer of a recovered material into a finished product

_____ B. Broker of materials with no processing capabilities

_____ C. Broker of materials with a facility that processes materials

_____ D. Material Recovery Facility (MRF) or Processing Facility

III. Please Circle all Regions of MISSOURI that you Currently Serve.

Northwest

North Central

Northeast

Kansas City Area

Central

St. Louis Area

Southwest

South Central

Southeast

MULTIPLE REGIONS

IV. How do you accept materials for processing?

Partial Loads

Truckload Quantities

V. Listing of materials accepted and the processing required:

Results, Page 2

Please enter the material processing codes that apply to your operation.

Material Processing Codes:
A = Loose
B = Baled
C = Crushed
G = Gaylords
X = Chipped
S = Shredded

ALUMINUM BEVERAGE CANS

DESCRIPTION: Aluminum beverage cans are still the most profitable recovered material producer, although there is less revenue than in past years. Recycling aluminum beverage cans are also good for the environment. Aluminum cans may be recycled endlessly with no loss of quality to the metal and it takes only 5% of the energy to recycle an old can compared to creating a can out of ore. Because aluminum recycling is so efficient there is a well-established network of end users to purchase your cans.

SUPPLY: Aluminum beverage cans are included in 99% of community recycling programs. A good community recycling program can expect to recover about two thirds of the aluminum beverage cans in circulation. According to the *Missouri Waste Composition Study* aluminum beverage cans comprise approximately 1.5% of municipal solid waste. That means that a community can expect to recover about 10,519 pounds of aluminum per year for every 1,000 residents served.

QUALITY REQUIREMENTS: Aluminum beverage cans cannot be mixed with any other type of metal, including other aluminum. Beverage cans are made from a different alloy than cast aluminum or aluminum foil and therefore must be kept separate. There are markets for cast aluminum and aluminum foil through scrap dealers if the quantities warrant. Another contaminate is liquid. Aluminum buyers do not want to pay premium prices for water so make sure your cans stay dry.

SHIPPING REQUIREMENTS: Most buyers prefer aluminum cans flattened but not baled. Baling will lock in some of the moisture. Some end users provide flattening or densifying equipment, spot a trailer at your location, and/or pay for freight in exchange for an exclusive contract to purchase your cans.

PRICING STRUCTURE: There are generally two pricing levels: transaction prices and street prices. The street price is what processors and buy-back centers pay individuals for small quantities. The transaction price is based on truckload quantities of contamination free cans. There is normally about 20 cents per pound difference between street and transaction prices. Prices will also vary during the year with higher prices normally paid during the winter and lower prices in the summer. Most end users prefer to work with recyclers who can consistently deliver good quality and quantity and will reflect that in the price they pay for the cans.

PRICING HISTORY: The following historical prices are an average and in no way guarantee present or future value of aluminum cans. However they do reflect trends and cycles. Prices are in cents per pound.

	1994	1995	1996	1997	1998	1999	2000	2001	2002
Street Prices	30	45	33	35	30	30	32	35	30
Transaction Prices	50	65	53	55	50	50	55	55	60

STEEL FOOD CANS

DESCRIPTION: Steel and tin cans are the same. The base metal is steel with a small amount of tin added to coat the surface. Recycling steel cans will not only divert part of solid waste from the landfill and add revenue to your recycling program, but it also saves energy. It requires 75% less energy to make a new can out of recycled steel than iron ore. The Steel Recycling Institute has established a national database of steel can buyers with a hot line (1-800-937-1226), and a web site (www.recycleroom.org) for education on steel recycling. They are very helpful in setting up community programs.

SUPPLY: Steel food cans are included in about 92% of community recycling programs. A good community recycling program can expect to recover about two thirds of the steel food cans in circulation. According to the *Missouri Waste Composition Study* steel food cans comprise approximately 3.1% of municipal solid waste. That means that a community can expect to recover about 21,708 pounds (11 tons) of steel per year for every 1,000 residents served.

QUALITY REQUIREMENTS: Steel food cans should not be mixed with any other type of metal. A good community educational program will be necessary to inform residents on how to prepare their cans for recycling. Residents should rinse out the cans to eliminate smell and reduce insect and rodent problems. It is not necessary to remove paper labels but sharp lids should be removed and put in the trash for safety purposes. Many buyers will allow a small amount of paint and aerosol to be mixed with the food cans. Oil filters, appliances, automobiles and steel from demolition projects may be recycled and sold to other buyers but cannot be mixed with the food cans.

SHIPPING REQUIREMENTS: Most buyers prefer steel food cans flattened or baled to make transportation more efficient. Some heavy-duty paper balers are adequate for baling steel cans but check with the baler manufacturer and the scrap buyer for specifications. As with most materials, truckload quantities command higher prices but the cost of storing the cans may offset the extra revenue.

PRICING STRUCTURE: Like aluminum cans, there are generally two pricing levels: transaction prices (truckload quantities) and street prices. There is a well-established chain of scrap dealers who buy ferrous (iron) and non-ferrous materials. Therefore, your best market for steel cans may be your local scrap dealer. Mills and foundries will pay higher prices for truckload quantities but demand good quality in their shipments.

PRICING HISTORY: The following historical prices are an average and in no way guarantee present or future value of steel food cans. However they do reflect trends and cycles. Prices are in dollars per ton.

	1994	1995	1996	1997	1998	1999	2000	2001	2002
Street Prices	\$15	\$20	\$20	\$15	\$20	\$25	\$30	\$15	\$15
Transaction Prices	\$50	\$75	\$70	\$50	\$55	\$60	\$65	\$45	\$45

GLASS BOTTLES

DESCRIPTION: Glass bottles and glass food jars are 100% recyclable and the highest use for recycled glass bottles is to remanufacture them into new bottles. There are about 60 glass production facilities in the U.S and most of those use some degree of cullet (old glass bottles and jars) as part of their raw materials to make new glass bottles. These production facilities buy their cullet from beneficiators (processors who screen out contaminants and crush the glass to a uniform cullet size. The Glass Packaging Institute (317-283-1603) offers several informational resources to help communities prepare cullet. Glass bottles may also be crushed and used as a replacement for sand, gravel and other aggregates. Glass can also be ground finely and used as an abrasive in sand blasting.

SUPPLY: Glass bottles are included in about 98% of community recycling programs. A good community recycling program can expect to recover about half of the glass bottles in circulation. According to the *Missouri Waste Composition Study* glass bottles comprise approximately 5.2% of municipal solid waste. Therefore, a community can expect to recover about 27,150 pounds (13 tons) of glass per year for every 1,000 residents served.

QUALITY REQUIREMENTS: Quality requirements depend on the purpose for which the glass will be used. If the glass will be sold to a beneficiator, the glass must be separated, stored, and shipped by color (clear, amber, and green). Metallic caps and paper labels can be left on the glass but all ceramics, coffee cups, plates, drinking glasses, light bulbs, plate glass, mirrors, plastics, and ovenware must be removed. This represents a major commitment to quality and may cost more than the price of the glass. Another option is to crush the glass and use it as an aggregate for roadbeds, septic tank lines, or an asphalt additive (glassphalt). These applications do not require color separation and are much more forgiving.

SHIPPING REQUIREMENTS: Shipments to beneficiators should be in dump vehicles and colors must be shipped separately. The distance to a beneficiator, and the shipping cost, will be a very big factor in determining the feasibility of this option. Using the glass locally as an aggregate will reduce costs but produce less revenue. In either case you will still save the cost of disposal at the transfer station or landfill.

PRICING STRUCTURE: Prices for cullet are set by the beneficiator and there's not much competition to drive up prices. The price of aggregate will fluctuate depending on the availability of sand and gravel.

PRICING HISTORY: The following historical prices are an average and in no way guarantee present or future value of glass bottles. However they do reflect trends and cycles. Prices are in dollars per ton.

	1994	1995	1996	1997	1998	1999	2000	2001	2002

#1 PLASTIC (PET or PETE)

DESCRIPTION: There are seven basic types of plastic, but only three are currently practical to recycle. Polyethylene terephthalate (normally referred to as PET or PETE) is the plastic found in clear or green soda bottles, water bottles, or any other bottle or container with a screw top lid that has a #1 inside the recycling symbol on the bottom of the container. Most of this material is manufactured into polyester fiber for clothing and carpets. The trade organization for PET is the National Association for Plastic Container Recovery (NAPCOR). They are an excellent resource to help communities set up a PET recycling program. Tim Warren at the regional office (314-273-4192) is very helpful

SUPPLY: PET bottles are included in about 83% of community recycling programs. A good community recycling program can expect to recover about two thirds of the PET bottles in circulation. According to the *Missouri Waste Composition Study* PET bottles comprise approximately 1.7% of municipal solid waste. Therefore, a community can expect to recover about 11,872 pounds (6 tons) of PET per year for every 1,000 residents served.

QUALITY REQUIREMENTS: There are some stringent quality requirements for PET. However, if you limit your program to only soda and water bottles you will still get more than 90% of the available PET and reduce your contamination problems. NAPCOR will provide a “Best Practices Report” which answers most quality and shipping concerns.

SHIPPING REQUIREMENTS: PET bottles are normally baled for shipment. NAPCOR will provide you with bale specifications. The main problem with PET is storage capacity. Unbaled PET bottles can take up several hundred cubic feet of space and present material handling problems.

PRICING STRUCTURE: Like most materials the prices vary depending on market conditions, quality, and quantity. National end users will pay the best prices but want a consistent flow of material and excellent quality without contamination.

PRICING HISTORY: The following historical prices are an average and in no way guarantee present or future value of PET. However they do reflect trends and cycles. Prices are in cents per pound.

	1994	1995	1996	1997	1998	1999	2000	2001	2002

#2 PLASTIC (HDPE)

DESCRIPTION: High Density Polyethylene (HDPE) is the plastic resin material from which milk jugs and detergent bottles are normally made. HDPE is normally separated and sold as natural (milk jugs) and colored (detergent bottles). Containers made from HDPE can be identified by looking for a #2 inside the recycling symbol on the bottom of the container. Most of this material is manufactured into “plastic lumber” which can be molded into almost any shape or size. The trade organization for HDPE is the American Plastics Council (APC).

SUPPLY: HDPE bottles are included in about 83% of community recycling programs. A good community recycling program can expect to recover about two thirds of the HDPE containers in circulation. According to the *Missouri Waste Composition Study* HDPE containers comprise approximately 2.1% of municipal solid waste. Therefore, a community can expect to recover about 14,607 pounds (7 tons) of HDPE per year for every 1,000 residents served.

QUALITY REQUIREMENTS: Quality is not quite as critical for HDPE as it is for PET but there are restrictions. There are actually two types of HDPE and they are not compatible with each other. At a temperature of 360 F., the blow mold grades (milk jugs, and detergent bottles) will be the consistency of taffy. The injection grade material (butter and yogurt tubs) is a free flowing liquid. When these two types of HDPE are combined in a mold injection process the end product will contain small stress fractures that weaken the end product. One solution for a community recycling program is to only accept blow mold grades that are bottles and jugs with a screw top lid and a #2 inside the recycling symbol on the bottom of the container.

SHIPPING REQUIREMENTS: HDPE bottles are normally baled for shipment. Check with your buyer early to get bale specifications. The main problem with HDPE is storage capacity. Unbaled HDPE bottles can take up several hundred cubic feet of space and present material handling problems.

PRICING STRUCTURE: Like most materials the prices vary depending on market conditions, quality, and quantity. There are several good end users in Missouri and prices are competitive.

PRICING HISTORY: The following historical prices are an average and in no way guarantee present or future value of HDPE. However they do reflect trends and cycles. Prices are in cents per pound.

	1994	1995	1996	1997	1998	1999	2000	2001	2002
Natural HDPE	9	22	6	16	10	6	14	20	7

PVC AND OTHER PLASTICS

DESCRIPTION: Polyvinyl Chloride (PVC) is not a normal material component in most community recycling programs. Industrial sources, agricultural applications (irrigation pipe) and demolition of buildings using vinyl siding will generate most PVC waste. Other resins are technically recyclable (mostly getting their material from industrial sources) but are not practical to include in a community recycling program. Some material is stamped with resin identification codes. These codes are:

#1	Polyethylene terephthalate (PET)	Soda bottles
#2	High Density Polyethylene (HDPE)	Milk Jugs
#3	Polyvinyl Chloride (PVC)	Vinyl siding, pipes
#4	Low Density Polyethylene (LDPE)	Plastic bags
#5	Polypropylene (PP)	Custom containers
#6	Polystyrene (PS)	Styrofoam
#7	A combination of any of the above	

SUPPLY: Resins #3-#7 are included in very few community recycling programs. According to the *Missouri Waste Composition Study* these resins comprise approximately 10.6% of municipal solid waste. However most of this waste is not practical to include in a residential recycling program. The amount available from industrial sources and deconstruction of house will vary from one community to another.

QUALITY REQUIREMENTS: Quality requirements are totally dependent on the buyer's specification and will vary considerably by resin type.

SHIPPING REQUIREMENTS: Shipping requirements are also totally dependent on the buyer's specification and will vary considerably by resin type.

PRICING STRUCTURE: Like most materials the prices vary depending on market conditions, quality, and quantity.

PRICING HISTORY: Pricing varies considerably by resin type and buyer. There is no reliable pricing history available.

NEWSPAPERS

DESCRIPTION: Newspapers are one of the most collected materials in most community recycling programs. Newspapers have been collected and recycled through fund raising drives for charitable organizations for years. For most of those years collecting old newspapers was relatively profitable for these organizations. However, the tremendous increases in community recycling programs have created a supply glut and as a result the prices for old newspapers have dropped. The recycling technology and infrastructure to deal with this large glut is trying to keep up but demand is still behind the supply.

SUPPLY: Newspapers are included in about 99% of community recycling programs. A good community recycling program can expect to recover about two thirds of the newspapers in circulation. According to the *Missouri Waste Composition Study* newspapers comprise approximately 7.9% of municipal solid waste. Therefore, a community can expect to recover about 55,000 pounds (27 tons) of newspaper per year for every 1,000 residents served.

QUALITY REQUIREMENTS: Sun, water, glass and time are the main contaminants. Sunlight damages newspaper's brightness and strength, water will rapidly decay it, broken glass in the newsprint causes problems at the processing plant, and sitting for more than six months causes the paper to become brittle and lose fiber strength. Therefore, newsprint should be kept indoors, kept dry, collected separately from glass bottles, and sent to market often.

There are two main grades of newsprint. Grade #8 consists only of the paper that is included in the daily or Sunday paper. Advertising "slicks" are permissible, but bags, office paper, junk mail, or magazines are contaminants and will cause the shipment to be downgraded to a grade #6 or rejected at the mill. Grade #6 is more forgiving. Check with your buyer for exact mill specifications.

SHIPPING REQUIREMENTS: Most buyers want your newspaper baled. Vertical balers are fine for small programs but a horizontal baler will save labor costs on large-scale operations. The best prices are paid for truckload quantities.

PRICING STRUCTURE: The key to selling newsprint is the same as all other materials - quality and quantity. Some brokers will combine loads of separately baled newsprint, cardboard and other fibers in order to make a truckload.

PRICING HISTORY: The following historical prices are an average and in no way guarantee present or future value of newsprint. However they do reflect trends and cycles. Prices are in dollars per ton.

	1994	1995	1996	1997	1998	1999	2000	2001	2002
Grade #6	\$30	\$120	\$20	\$15	\$17	\$18	\$40	\$45	\$40

CARDBOARD and BOXBOARD

DESCRIPTION: Cardboard boxes have been recycled in one form or another for many years and the recovery rate for cardboard has risen steadily. Prior to 1990 less than 50% of the cardboard was recycled and most of that came from commercial operations with balers in-house. By 1998 over 70% of the cardboard in America was recycled. Boxboard (cereal boxes etc.) is the poor cousin of cardboard. Boxboard markets are more difficult to find than cardboard markets and the prices paid are significantly less. However in many cases the same buyers who purchase cardboard will purchase boxboard, or allow it to be mixed with the cardboard in small quantities.

SUPPLY: Cardboard/boxboard is included in about 90% of community recycling programs. A good community recycling program can expect to recover about half of the cardboard/boxboard in circulation. According to the *Missouri Waste Composition Study* this material comprise approximately 6.7% of municipal solid waste. Therefore, a community can expect to recover about 35,000 pounds (17 tons) of cardboard/boxboard per year for every 1,000 residents served.

QUALITY REQUIREMENTS: The primary contaminants are food, glass particles, and wax or coated cardboard. Food contamination in the material will present insect and rodent problems. Broken glass in the material is a major problem for the pulping mills that will turn the material into new boxes. Wax coated boxes (about 5% of the total boxes) are not repulpable at the mill and may cause your entire load to be rejected. Cardboard bales may be stored outside but the mill will check the moisture content and deduct prices accordingly.

SHIPPING REQUIREMENTS: Cardboard must be baled for shipment to a mill. Specifications of bale size may vary so it is wise to check with your buyer before committing to a baler. Vertical balers are fine for small programs but a horizontal baler will save labor costs on large-scale operations. The best prices are paid for truckload quantities. Some brokers will combine loads of separately baled newsprint, cardboard and other fibers in order to make a truckload.

PRICING STRUCTURE: The key to selling Cardboard is the same as all other materials - quality and quantity. Prices are somewhat cyclical and a lot depends on the foreign markets.

PRICING HISTORY: The following historical prices are an average and in no way guarantee present or future value of newsprint. However they do reflect trends and cycles. Prices are in dollars per ton.

OTHER PAPER PRODUCTS

DESCRIPTION: There are more than 70 grades of paper recognized by most paper buyers. Many of these grades consist of office and computer papers. Since it is virtually impossible for any processing facility to separate every grade of paper, some decisions will need to be made concerning which paper grades are collected. In most cases your paper buyer will have a recommendation on what types of paper to combine and what to omit. The list of buyers in this directory purchase a variety of paper grades. Some buyers may have outlets for a residential mix that is very forgiving but also very low in value. Therefore you will need to decide if the convenience factor is worth the lower material price.

SUPPLY: Mixed paper (office or high-grade paper) is included in about 75% of community recycling programs. A good community recycling program can expect to recover about half of the mixed paper in circulation. According to the *Missouri Waste Composition Study* this material comprise approximately 3.6% of municipal solid waste. Therefore, a community can expect to recover about 18,000 pounds (9 tons) of mixed paper per year for every 1,000 residents served.

QUALITY REQUIREMENTS: The quality requirements for mixed paper will vary greatly from one buyer to another and will depend mostly on what product the paper mill is producing from this material. However, the basic rules will be the same as other recovered paper. Keep the paper dry, protected from sunlight, and free from any type of broken glass. Marty McKay at Central Paper Stock (314-521-8686) is an excellent source for information about recycled paper.

SHIPPING REQUIREMENTS: Most mixed paper loads must be baled for shipment to a mill. Specifications o bale size may vary so it is wise to check with your buyer before committing to a baler. Vertical balers are fine for small programs but a horizontal baler will save labor costs on large-scale operations. The best prices are paid for truckload quantities. Some brokers will combine loads of newsprint, cardboard and other fibers in order to make a truckload.

PRICING STRUCTURE: The key to selling mixed paper is the same as all other materials - quality and quantity. Don't expect to make a lot of money selling this type of material. However, you are still avoiding the disposal cost at the landfill or transfer station and providing a service for those residents that want to do something to save the environment.

PRICING HISTORY: The following historical prices are an average and in no way guarantee present or future value of newsprint. However they do reflect trends and cycles. Prices are in dollars per ton.

	1994	1995	1996	1997	1998	1999	2000	2001
Mixed Residential	\$0	\$0	\$7	\$0	\$0	\$0	\$0	\$5
Mixed Office	\$80	\$175	\$50	\$55	\$50	\$45	\$40	\$45

ELECTRONICS

DESCRIPTION: The term Electronics Recycling is somewhat confusing. There are thousands of products that use electricity in one form or another and all of these could theoretically be recycled. For the purpose of this document, the term "Electronics" primarily refers to televisions and computers and related hardware.

Unlike the other categories of waste discussed in this document, this waste (or resource) is not homogeneous. Its various components have different economic values and different problems associated with recycling them. Circuit boards have different properties than cases, which have different properties from monitors (and their cathode ray tubes). Cathode ray tubes (CRT's) in television and computer monitors are one of the most common components of discarded electronics in the solid waste stream. Each monitor has several pounds of lead in the form of leaded glass. Circuit boards contain copper, silver, cadmium, mercury other precious metals and plastics.

Some of these materials are hazardous and require special handling, both in demanufacture and shipping. Recyclers should check with the Hazardous Waste Program (573-751-3176) to see whether their methods fall under regulation.

SUPPLY: The *National Safety Council* estimates that over 315 million computers will become obsolete by the year 2004. However, just because a computer is obsolete, it is not necessarily thrown away. In 1998 only six percent of the older computers were recycled compared to the new computers put on the market that year. In 1999, Twenty-four million computers in the United States became "obsolete" but only about 3.3 million (14%) were recycled or donated. The rest were dumped, shipped to other countries, or put into temporary storage (the basement). By the year 2005, one computer will become obsolete for every new one put on the market.

QUALITY REQUIREMENTS: Each electronics recycler has their own guidelines for what they will accept and how it should be shipped. Some recyclers disassemble the computers and monitors and remove the circuit boards and computer chips. Others recycle the leaded glass found in the cathode ray tubes (CRT's). Each recycler will have a list of acceptable, or non-acceptable items that they will, or will not accept.

SHIPPING REQUIREMENTS: One of the main costs of recycling will be the cost of shipping computers and monitors to the disassembly facility. Stock piling the units and shipping full truckload quantities is the most economical strategy to reduce freight costs. Some of the Solid Waste Management Districts have begun to address this problem. Call your local Solid Waste Management District Planner for details.

PRICING STRUCTURE: The electronics, and particularly the computer industry has developed so quickly that most obsolete computers and monitors do not have a positive value. New technology in chips and circuit boards makes new computers cheaper and better than computers made from recycled parts. Many electronics recyclers charge a fee to accept these units. The hope is that this will change as more computers are turned in for disassembly.

PRICING HISTORY: The field of electronics recycling is so new, and the range of units accepted is so variable, that pricing history is not reliable. Several states, including Missouri, have formed a task force to study electronics recycling.

OTHER MATERIALS

Occasionally there is a need for markets for recovered materials that will not be picked up on a curbside recycling route or left at a drop-off center. The following items are included under “Other Materials”

Tires These include auto and truck tires. Whole tires are not accepted at Missouri landfills or transfer stations because they will trap air and rise to the surface of a landfill breaking the cap and exposing other trash to the environment. They may be put into a landfill if they are quartered or split. In most cases there will be a fee to have these tires picked up or dropped off at a tire processor. These processors are listed in this section. Most processors can provide information concerning tire collectors that will pick up tires at your location.

Wooden Pallets Pallets and wood crating are excellent candidates for recycling. Pallets can be rebuilt and sold to manufactures as an alternative for new pallets. When a wooden pallet is recycled it not only frees up landfill space but it also reduces the demand for virgin lumber. Most pallet rebuilders will accept rebuildable pallets at no charge, therefore saving the cost of disposal.
